OSI China Installs Water Recycling System

New system improves water usage efficiency and reduces power consumption

Shanghai, China – A water treatment and recycling system was designed and installed to recover and reuse “one-time use” water at a production facility here. The water, which would have been used only one time before disposal, is now collected and treated for additional use. The treated water is now pumped through the system to areas where fresh water may have previously been used for cooling purposes. These areas include the microwave generator, freezer condensers, and vacuum pumps of forming and tumbling equipment.

The resulting savings have been in both water (250 tons) and power consumption (890 Kilowatt hours per production day). These savings have an effect on both the environment and on cost savings efforts.
